

Growing Smarter, Growing Better.

How automation benefits nursery workers, producers, & the plants you love

Innovations range from simple tools that reduce strain to advanced systems that transform entire production lines

Simple

Fertigation

The process of delivering fertilizers directly through an irrigation system, allowing nutrients to be applied to crops simultaneously with watering

Smart Irrigation

Technology driven irrigation systems that use sensors, weather data, and automated controls to apply water only when and where crops need it, reducing water waste and improving efficiency

Advanced

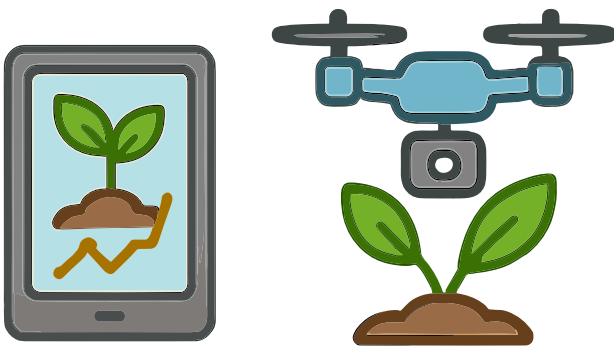

Automated Pot Movers

Autonomous machines used in greenhouse operations that transport potted plants along production lines, reducing labor costs and improving efficiency.

Smart Irrigation

Artificial intelligence systems that analyze images or sensor data from crops to identify signs of disease, pest damage, or nutrient deficiencies early, enabling faster and more targeted interventions

AI can detect plant pests & diseases faster than the human eye

Reduces time workers spend under extreme conditions

Smart irrigation systems reduce water use by up to 30%
